Fund Analyzer

A simple guide to how we compare your mutual funds

Compare • Overlap • Fundamentals • Saved PDF report

What is the Fund Analyzer?

The Fund Analyzer is the tool we use to look closely at the mutual funds you own, or are thinking of buying. You pick the funds, and it shows you, side by side, **how each fund has performed**, **how risky it has been**, **what it costs**, and **whether your funds are secretly holding the same shares**.

Why this matters to you

- **Real diversification.** Owning five funds is not the same as owning five different things. If they all hold the same big companies, your money is less spread out than it looks.
- **Fair comparison.** Returns, risk and cost are shown in the same way for every fund, so you can compare like with like.
- **Clear costs.** You see the yearly fee (expense ratio) each fund charges.
- **A record you keep.** Every analysis can be saved as a PDF report for your files.

Where the numbers come from

AMFI (Association of Mutual Funds in India): the official daily price (NAV), expense ratio and fund size (AUM) of every scheme.

Each fund house (for example HDFC, SBI, Nippon): the official monthly list of every share and bond the fund holds.

NAV history: from AMFI, or from MFAPI, a public copy of AMFI data, if AMFI is slow. The screen always shows which one was used.

If some data is missing, the tool shows **"unavailable"**. It never guesses or makes up a number.

1 How it works

Five simple steps, from choosing funds to saving your report.

1 **Choose funds** Search by name, code or ISIN → 2 **Update analysis** One click loads the latest data → 3 **Read the summary** Four headline cards → 4 **Explore the tabs** Compare, Overlap, Fundamentals → 5 **Save report** Download a PDF copy

Step 1: Choose the funds

Type a few words of a fund's name, for example *"HDFC Large Cap"*, and pick it from the list. Words can be in any order. Add as many funds as you want to compare. The **Direct Growth** option is shown first because it has the lowest cost. Your selection is remembered even if the page is refreshed. **Clear all** removes every fund.

Step 2: Press "Update analysis"

The tool fetches the latest official data for all your funds at once. The first time can take a few seconds while fund-house files are downloaded; after that it is almost instant. You will see the progress, such as *"Fetching portfolio holdings..."* and *"Calculating overlap..."*.

Step 3: Read the four summary cards

Card	What it tells you	Example
Top 3Y CAGR	Which fund grew fastest over the last 3 years, as a yearly average.	+17.36% a year
Best risk-adjusted	Which fund gave the most return for the ups and downs it went through (Sharpe ratio). Higher is better.	0.89 Sharpe
Lowest volatility	Which fund had the smoothest ride, with the smallest day-to-day swings.	12.18%
Highest overlap	The two funds that share the most of the same holdings.	47.52%

A tip on the summary cards

The "Best risk-adjusted" card compares all selected funds together. A liquid or debt fund moves very little, so it can top this card even though it is built for a different purpose than an equity fund. Compare funds of the same type for a fair picture.

Steps 4 and 5: Explore the tabs, then save

Below the cards are three tabs: **Compare**, **Overlap** and **Fundamentals**. Each is explained on the next pages. When you are done, **Save report** downloads everything as a PDF.

Mutual fund investments are subject to market risks. Read all scheme-related documents carefully.
Past performance may or may not be sustained in future.

2 The Compare tab

Performance, risk and cost of every fund in one table.

Each row is one fund. Each column answers one question. The best fund in each column has a gold outline.

Column	In simple words	Good to know
NAV	The price of one unit of the fund today.	A high or low NAV does not make a fund better or worse.
1M, 3M, 6M, 1Y	How much the fund went up or down over the last 1, 3, 6 or 12 months.	Short periods move a lot. Do not judge a fund on one month.
3Y CAGR, 5Y CAGR	The average yearly growth over 3 or 5 years.	The fairest way to compare long-term performance.
Volatility	How much the price jumps around. Lower means a smoother ride.	Equity funds are usually 10% to 20%; liquid funds below 1%.
Sharpe	Return earned for each unit of risk taken, above a safe 6.5% return.	Higher is better. Below 0 means it did worse than a safe deposit.
Max DD	The biggest fall from a high point to a low point in 3 years.	Shows the worst drop you would have lived through.
TER	The yearly fee the fund charges (expense ratio).	Already taken out of the NAV. Lower is better.

Example: reading one row

Real figures for **HDFC Large Cap Fund (Direct Growth)**, NAV date 5 November 2026:

• **3Y CAGR 10.39%**: ₹1,00,000 invested 3 years ago would be about **₹1,34,520** today (1.1039 × 1.1039 × 1.1039 = 1.3452).

• **Max DD −16.36%**: at its worst point in 3 years, that ₹1,00,000 had temporarily fallen to about **₹83,640** before recovering.

• **TER 1.01%**: about **₹1,010 a year** for every ₹1,00,000 invested, already included in the NAV.

• **Volatility 13.66%, Sharpe 0.29**: a normal large-cap level of ups and downs, with a modest reward for that risk.

Example only, to explain the columns. Not a recommendation to buy or sell.

3 The Overlap tab

Are your funds really different, or do they own the same shares?

Every fund publishes, each month, the full list of shares and bonds it owns and how much of the fund each one is. The Overlap tab puts two funds' lists side by side and adds up the part they have **in common**.

How the overlap is worked out

For every share both funds own, we take the **smaller** of the two weights and add them up. Shares are matched by their official code (ISIN), so two different bonds from the same company are never mixed up.

Share	Fund A holds	Fund B holds	Counted as common
HDFC Bank	8%	6%	**6%** (the smaller one)
ICICI Bank	6%	7%	**6%**
Infosys	4%	2%	**2%**
Reliance	5%	not held	0%
TCS	not held	5%	0%
Overlap			**6 + 6 + 2 = 14%**

A simple made-up example. 14% means that 14% of each fund's money is invested in exactly the same places.

How to read the result

Overlap	What it means	What to consider
Below 25%	Low overlap. The funds are genuinely different.	Good diversification between these two.
25% to 50%	Moderate overlap. A fair part of your money is in the same shares.	Check whether you need both funds.
Above 50%	High overlap. The funds are very similar.	You may be paying two fees for much the same portfolio.

Real example

HDFC Large Cap Fund and **SBI Large Cap Fund**, using both funds' official September 2026 portfolios: **47.52% overlap**, from **18 shares** they both own.

In plain words: almost half of the money in these two funds sits in the same 18 companies. Holding both adds less variety than it seems.

Mutual fund investments are subject to market risks. Read all scheme-related documents carefully.
Past performance may or may not be sustained in future.

3 The Overlap tab (continued)

What appears on screen, and what each message means.

What you see on this tab

- **Overlap matrix**: a grid with every pair of funds. Darker squares mean more overlap. Click a square for details.
- **Pair details**: the shares both funds hold, how much each fund holds, and how much each share adds to the overlap.
- **Highest overlapping pairs**: the pairs ranked from most to least similar.
- **Portfolio month**: the month of the holdings used, for example September 2026. Two funds are always compared on the **same month**.
- **Holdings source**: "Official AMC" means the fund house's own file. "Third-party API" is marked clearly if a backup source was used.

Message	Meaning
0.00% No common securities	Both portfolios were checked, and they share nothing. This is a real result.
Holdings unavailable	A portfolio could not be obtained, so no figure is shown. It does **not** mean 0%.
No common reporting month	The two funds' latest lists are from different months, so they are not compared.
Partial coverage: 10/28 pairs	Some pairs could be compared and some could not. The reasons are listed.

Equity, debt and hybrid funds

Equity funds are compared on shares, debt funds on bonds, and hybrid funds on both. Cash, repo and units of other funds are left out, so only real direct holdings count.

Mutual fund investments are subject to market risks. Read all scheme-related documents carefully.
Past performance may or may not be sustained in future.

4 The Fundamentals tab

What each fund owns, what it costs and how risky it is.

Each fund has its own card. Press **View full details** on a card for the complete picture.

On each card

Item	In simple words
Riskometer	SEBI's official risk label, taken from the fund house's own disclosure. It is never estimated by us.
NAV and 1Y	Today's unit price and the return over the last 12 months.
Expense	The yearly fee (TER), as published by AMFI.
AUM	The total money managed by the fund, in crore rupees. Example: ₹39,519 Cr.
Top holdings	The biggest shares or bonds in the fund, with the % of the fund in each.

The six riskometer levels

Low	Low to Moderate	Moderate	Moderately High	High	Very High

Example: a large-cap equity fund is usually **Very High**; a banking and PSU debt fund is usually **Moderate**.

In "View full details"

- **Top 10 holdings**, with a button to see every holding. Debt holdings also show the type (for example a government security) and the credit rating (for example CRISIL AAA).
- **Asset allocation**: how the money is split, for example 95% Indian shares and 5% cash and others. Hybrid funds show the equity and debt parts.
- **Sector allocation**: the industries the fund invests in, for example Banks 30% and IT 12%. Debt funds show the instrument types instead.
- **Key facts**: benchmark index, 3Y and 5Y growth, volatility, maximum fall and Sharpe ratio.

> **Good to know**
>
> **Holdings above 100%.** Some liquid funds show slightly more than 100% in securities. This is normal at month end: money waiting to be paid out appears as a small negative balance.
>
> **Dates.** Holdings are monthly (the latest published month). NAV is daily. Each date is printed on the card.

Mutual fund investments are subject to market risks. Read all scheme-related documents carefully.
Past performance may or may not be sustained in future.

5 Your saved report

Keep a copy of every analysis.

Press **Save report** at the top of the page. A PDF named like *"Fund Analyzer Report - 2026-11-06.pdf"* is downloaded. It contains:

- The funds you selected, with their scheme codes and categories.
- The full returns, risk and cost table from the Compare tab.
- The highest overlap, every pair's overlap with its month and source, and any pairs that could not be compared, with the reason.
- Fund size, expense ratio, riskometer, benchmark and top 10 holdings of each fund.
- The date and time it was made, and the source of the data.

Common questions

Question	Answer
Why are holdings from last month, not today?	Fund houses publish their full holdings once a month, a few days after the month ends. The tool always uses the latest published month.
Why does one fund show "unavailable"?	Some fund houses publish their files in a way the tool cannot read yet. Rather than guess, it says so clearly.
Is a high overlap always bad?	Not always. But if two funds overlap a lot, you are paying two fees for similar investments, and you are less diversified than it seems.
Is the fund with the best return always the best choice?	No. Look at risk (volatility, maximum fall), cost (TER) and whether the fund fits your goal. Past returns may not repeat.
Is the data official?	Prices, fees and fund size come from AMFI. Holdings come from each fund house's official monthly file. Any other source is clearly labelled.

Important

This guide and the Fund Analyzer are tools to help you understand your investments. They are not, by themselves, advice to buy or sell any fund. Please discuss any changes to your portfolio with your adviser at MNS Financial Services.
